

PhishScout[®]

Phishing Incident Response

Analyze, Quarantine & Delete
Suspicious emails in seconds
using 90+ built-in threat intelligence feeds

PhishScout is an automated phishing defense & orchestrated response solution that allows the IT security teams to instantly investigate suspicious emails with the ability to quarantine and ultimately delete phishing emails from the end user's mail box.

PhishScout has built-in integration with **90+ threat intelligence feeds & databases** to instantly thwart a phishing attack. The automated & orchestrated response workflow ensures role-based coordination between relevant stakeholders to report, investigate, quarantine and delete phishing emails from the end user's mailbox in the shortest possible time.

PhishRod provides a reporter plug-in that works as an agent for all mail clients. While the mailbox synchronizes to receive any incoming email, the end user is provided with a warning that the email is coming from a malicious source.

Once reported, **PhishScout** extracts the links & attachments from the reported suspicious email and automatically creates an incident. The primary analyst can conduct IP Reputation Analysis, Domain Reputation Scanning, URL Scanning, Site Verification, Email Verification, and Attachment Scanning using 90+ intelligence feeds. Based on

- **Domain Reputation**
- **Attachment Scanning**
- **URL Scanning**
- **Site Verification**
- **IP Reputation**
- **Email Verification**

the results received, the primary analyst can immediately quarantine the reported email and escalate the case for secondary analysis. Based on the feedback from the secondary analyst, the email can be deleted from all end user mailboxes immediately.
